## Quicklight Benefits

To the knowledge of product management, Capri Lighting was the first company to offer a down light built upon a plastic frame. More than simply being plastic, the frame has a self leveling flange which insures the fixture to be level with each installation.

Being plastic, the fixture is non-corrosive and non-conductive. Should a lead become pinched between the junction box and door, the non-conductive nature of the plastic may prevent shorts and unnecessary trouble shooting time. Additionally a captive junction box door prevents lost components or unnecessary ladder trips for dropped parts.

Also important to note is that each case/ carton of Capri Quicklights ships automatically with 50% of the 27 inch flat BH3 barhangers. With standard case quantities of 8, four sets of BH3's are included, should the need arise for off joist mounting.
